Abstract
The purpose of this study is to examine the relationship between ownership structure, corporate governance, and dividend policy. The sample in this study is a financial company listed on the Indonesia Stock Exchange in the period 2014–2016. The results showed that managerial ownership is positively related to dividend policy. Institutional ownership is negatively related to dividend policy. Board size is negatively related to dividend policy, while independent board is positively related to dividend policy.

Keywords: managerial ownership, institutional ownership, board size, independent board

1. Introduction
The debate over dividend policy was initiated by Gordon (1959), Lintner (1956) and Miller dan Modigliani (1961), which remains a controversial issue today. Black (1976) in his “The Dividend Puzzle” supported Kinkki (2001) cannot explain what a company should do about dividend policy. Some studies offer an alternative and interesting approach as a solution. Much of the research is rooted in information asymmetry between insiders and outsiders as well as ownership and control structures. In agency theory frameworks, Crutchley dan Hansen (1989) suggest one way to reduce the cost of equity agents is by increasing dividends (Easterbrook, 1984; Rozef, 1982). A larger dividend payout will increase the chances of an increase in external equity capital, so that the activity of the manager will be monitored by the stock exchange, stock commissions, investment bankers, and new capital providers. This monitoring encourages managers to act more in line with the interests of shareholders. Jensen dan Meckling (1976) argue that conflicts between principals and agents occur because they act for their own interests. However, unlike in developed countries, agency problems occur between majority shareholder and minority (Claessens et al., 2000; La Porta et al.,
Majority shareholders tend to take over minority shareholders. That is why good corporate governance is needed to protect minority shareholders right.

There are two theories in the relationship between corporate governance and dividend policy: outcome and substitution (La Porta et al., 2000). In the theory of outcome mentioned that there is a positive relationship between corporate governance with dividend policy (Kowalewski et al., 2007; La Porta et al., 2000). On the other hand, in the substitution theory mentioned that the weaker corporate governance practice, the company will provide higher dividends (Renneboog dan Szilagyi, 2006).

In Indonesia, the government has issued strong regulations in encouraging companies to implement good corporate governance. However, until this time, Indonesian firms are still relatively weak in the implementation of good corporate governance. In 2015, Indonesia was only able to place its two companies in the list of 50 Best Issuers in Good Corporate Governance Practices in ASEAN in the awarding of the ASEAN Corporate Governance Awards 2015 organized by the ASEAN Capital Markets Forum (ACMF) in Manila, Philippines, under Thailand, Singapore and Malaysia. This study follows the recommendations of Setiawan dan Kee Phua (2013), using the financial firm as the research sample.

2. Theoretical Review

Jensen dan Meckling (1976) argue that a conflict of interest exists between the principal and the agent because they act for their own interests. However, in developing countries, agency problems also occur between majority shareholders and minority shareholders (Claessens et al., 2000; La Porta et al., 2000). Therefore, good corporate governance mechanism is needed to protect the interests of minority shareholders, such as dividends payment. In previous research, ownership is one of the important variables that influences dividend payout ratio (Kumar, 2006). Managerial ownership positively related to dividend payout ratio, while institutional ownership negatively related to dividend payout ratio. Al-Najjar dan Kilincarslan (2016) found that institutional investors is negatively related to dividend payment, while board size has a positive effect on dividend payment.

Bokpin (2011) in his research on the Ghana Stock Exchange found that insider ownership, board size and independent board has a positive effect on dividend policy. Roy (2015) found that institutional investors negatively affect dividend payout, while board size and independent board have positive effect on dividend payout. Setiawan dan Kee
Phua (2013) in his research found that board size was negatively related to dividend policy.

Based on the literature review that has been described previously, the hypothesis in this study:

H₁: Managerial ownership is positively related to dividend policy
H₂: Institutional ownership is negatively related to dividend policy
H₃: Board Size is negatively related to dividend policy
H₄: The Independent Board is positively related to dividend policy

3. Research Methodology

We select our sample from financial firm that listed at Indonesian Stock Exchange that announce dividend from 2014-2016 periods. In order to measure corporate governance practice, we use board size and independent board. To test the hypothesis, we applies regression analysis:

\[ DPR = a + b₁ MOWN + b₂ INST + b₃ BZ + b₄ INDB + e \]

1. DPR = Dividend Payout Ratio
2. MOWN = Managerial Ownership
3. INST = Institutional Ownership
4. BZ = Board size
5. INDB = Independent Board

4. Discussion

The sample in this study is a financial firm listed in Indonesia Stock Exchange which announces dividend payment in the period of 2014-2016. The financial firm selected as the research sample is a recommendation of previous research (Setiawan dan Kee Phua, 2013). Financial companies listed on the Indonesia Stock Exchange are 79 companies, and only 27 companies are announcing dividend payment during 2014-2016. Total observations are 81 firm-year observations. The following table presents the descriptive statistics of this research.
TABLE 1: Descriptive Statistics.

</table>

Notes: n = 81; MOWN = Managerial Ownership; INST = Institutional Ownership; BS = Board size; INDB = Independent Board; DPR = Dividend Payout

From Table 1, the descriptive statistics for managerial ownership show that the actual range is 0% to 67.9%, with a mean of 2.5148%. This result show that the existence of managerial ownership in the ownership structure of financial firm is very low. institutional ownership is in the range of 0% to 90.34% with a mean of 23.1544%. Board size is in range 6 to 20, with a mean of 10.8395. Mean board size is high enough, CEOs will be more difficult in leading and controlling councils as the number of boards increases over 10 members. The opportunity for each individual in the council to exert influence in decision-making becomes more limited and any meetings made become more uncontrollable (Harper, 2007). Although, with a larger number of board members increasing the number of expert skills and abilities of the board, it is often more difficult to coordinate because of the greater number of interactions among members (Goodstein et al., 1994). Independent Board is in range 0.14 to 0.4, with a mean of 0.2417. Companies in Indonesia Stock Exchange are required to have an independent board composition of at least 30%. Companies in Indonesia Stock Exchange are required to have an independent board composition of at least 30%; thus the average composition of independent board in the sample company is below 30%. This shows the weak of good corporate governance practice by companies in Indonesia Stock Exchange.

Notes: * Significant 1 per cent; n = 81; MOWN = Managerial Ownership; INST = Institutional Ownership; BS = Board size; INDB = Independent Board; DPR = Dividend Payout

From table 2, Managerial Ownership is positively related to dividend policy (insignificant). These results confirm the findings of Kumar (2006) and Bokpin (2011), who found
a positive correlation between managerial ownership and dividend policy. This suggests that improving managerial ownership at some threshold, will make the insider feel no more benefit to increase dividend payouts. These results support the entrenchment hypotheses (Fama dan Jensen, 1983). Based on this result, H1 is accepted.

Institutional ownership is negatively related to dividend policy (insignificant). These results also confirm the findings of Kumar (2006) and Roy (2015), who found a negative correlation between institutional ownership and dividend policy. This is in line with the behavior of institutional investors, as institutional investors are also the creditor of the company, so they are very concerned to protect their credit. Based on this result, H2 is accepted.

Boards size negatively correlated to dividend policy (significant at 1%). These results confirm the findings of Setiawan dan Kee Phua (2013) who found a negative correlation Board size and dividend policy. This shows the weak implementation of good corporate governance in financial firm. Based on this result, H3 is accepted.

Independent board is positively related to dividend policy (significant at 1%). These results are in line with the findings of Bokpin (2011) who found a positive correlation between Independent board and dividend policy. This indicates that an increase in the board of independent commissioners will encourage the company to pay a larger dividend. Based on this result, H4 is accepted.

5. Conclusion

The percentage of shares owned by the manager greatly affects the payment of dividends. In the Indonesian financial firms, the insider ownership is very low. This causes managers are reluctant to make dividend payments. Statistically only 27 financial companies are paying dividends throughout 2014-2016 from 79 listed financial firm in Indonesia Stock Exchange. These results are in line with Crutchley dan Hansen (1989) which states that an increase in the percentage of share ownership by managers, will make managers motivated to improve performance and more responsibly improve shareholder wealth through dividend payouts.

The low implementation of good corporate governance in Indonesia has an impact on dividend policy in accordance with the findings of Setiawan dan Kee Phua (2013). Indonesian financial firms tend to compensate their poor corporate governance through higher dividend payment. There is a negative effect of board size on dividend payment. Therefore this research confirms the application of substitution theory in Indonesia rather than outcome theory. However, on the other hand, the existence
of an independent board of commissioners encourages companies to make larger dividend payments.

Limitation in this study: the number of financial companies that make dividend payments only 34.1% of 79 companies. In the future research is recommended to extend the time of the study, so that obtained data and better results
