Abstract

Sexually transmitted diseases (STDs) or venereal diseases are transmitted through various methods of sexual intercourse (oral, vaginal, and anal). The predisposition to this type of diseases and infections depends on the immunity system of the body, so the lower the immunity system's strength, the greater the risk of Sexually transmitted infections (STIs). The most important pathogenic causes of STIs include bacteria, viruses, and parasites. Phytochemical investigations have shown that medicinal plants are a rich source of antioxidant compounds, biologically active compounds, phenols, etc. They can have an inhibitory effect on germs and infectious viruses and are very important for a variety of parasitic diseases, microbial infections, and STIs. Some of the most important medicinal plants that produce inhibitory effects on the growth and proliferation of pathogenic agents of the STIs were reported in the present article. Based on the results obtained from the review of numerous articles indexed in the databases the Institute for Scientific Information, Scopus, PubMed, Google Scholar, etc., a number of plants have been reported to be used in the treatment and prevention of genital tract diseases and STIs, and to produce antiviral and antimicrobial effects, including Taxillus, Aristolochia, Syzygium cumini, Albizia adiantifolia, Bidens pilosa, Carica papaya, Ranunculus, Peltophorum africanum, Vachellia karroo, Rhoicissus tridentate, Houttuynia cordata, Panax notoginseng, Nelumbo nucifera, Astragalus, Hypericum aethiopicum, Spondias mombin, Jatropha zeyheri, Ximenia caffra, Trichilia dregeana, Clematis brachiate, Tabernaemontana, Sarcophyton. Phytochemical investigations have examined the therapeutic and clinical effects of medicinal plants, and the use of their active ingredients to produce herbal drugs has been addressed. The results of phytochemical investigations have shown that the most important compounds of these plants include quercetin, isoquercitrin, Dammaren-type saponin, flavonoids, alkaloids, flavonoids, glycosides, terpenoids, steroids, astragalosides, flavonoids and polysaccharides, α-pinene, β-pinene, α-pinene, quercetin, myricetin and luteolin flavonoids, β-pinene, 1,3,8-p-menthatriene, ledene, m-methane, linalyl acetate and...
3-carene, β-sitosterol, lupeol, lupeol, sitosterol, spathulenol, β-sitostenone, γ-sitosterol, stigmasterol. Due to the main active ingredients and flavonoids of these plants, they can be used to produce herbal drugs that reduce genital tract (microbial, viral, and fungal) infections and STIs, and therefore reduce pain and suffering in patients.

Keywords: sexually transmitted infections, genital tract infections, antibacterial and antiviral medicinal plants, medicinal plants, natural antioxidants

1. Introduction

Sexually transmitted diseases (STDs) or infections (STIs) or venereal diseases are umbrella terms to refer to various diseases that are transmitted through various methods of sexual intercourse (oral, vaginal, and anal). Some of these diseases are transmitted via other routes than sexual intercourse [1–5]. STDs may be caused by bacteria, virus, or parasite. The symptoms, transmission routes, and treatment methods of the STDs are different [6–9]. Almost all people are predisposed to STDs, and the lower the strength of their immune system, the more likely they are to develop STDs [10–13].

Using certain devices such as condoms can reduce the risk of developing STDs, but there are no fault-free and completely safe methods to prevent the development of these diseases. Some diseases, such as hepatitis, can be transmitted through a contact with the infected person's blood without sexual intercourse, but some other diseases, such as gonorrhea, are transmitted only through sexual intercourse [11–14].

The most important STIs, which are caused by bacteria, can be easily treated with antibiotics. Chlamydia; gonorrhea, syphilis. Chlamydia: Chlamydia is a bacterial infection affecting the genital tract [15–18]. Viral STDs: Some STDs are caused by viral pathogens that are much more difficult or even impossible to cure. Their symptoms can rarely be eliminated; hepatitis B, hepatitis C, herpes simplex virus (HSV), human immunodeficiency virus (HIV), human papillomavirus (HPV), and genital warts. HIV infection is caused by the human immunodeficiency virus. HIV affects the ability of the body to fight viruses, bacteria, and fungi that develop during the disease and can lead to AIDS. AIDS is a life-threatening disease [19–22]. Parasitic STDs: Some STDs are caused by parasitic agents. This kind of STDs are caused by sexual intercourse or through close contact with the skin, including scabies, trichomonas, and pubic lice [23–25]. Trichomonas is one of the most common STDs caused by a microscopic parasite called Trichomonas.
vaginalis. The disease is transmitted and spread through sexual intercourse in people who are predisposed to infectious diseases. This disease most often affects the urethra in men and vagina in women but is usually asymptomatic [26–29].

1.1. Vaginal infections

Vaginal infection: A vaginal infection has symptoms similar to those of an STD, but it is not classified as an STD. Genital and urinary tract infections: Genital and urinary tract infections are uninvited guests of any woman’s body [30–33]. The secretions and infections of the female reproductive system: Abnormal increase in vaginal discharge is due to a variety of reasons, commonly referred to as vaginitis [34, 35].

A. Vaginal yeast infections

In women’s vagina, yeast normally lives in small amounts, and the acidic environment of the vagina prevents the growth of the yeast. Now, if the acidity of the vaginal environment is reduced for some reason, the yeast will grow and lead to vaginal yeast infection. Various genital tract infections are among the common diseases that many women at a wide variety of ages may develop, especially vaginal yeast infection, which is more likely to develop during pregnancy [36–38].

B. Bacterial vaginitis

The vaginal environment contains a type of bacterium known as good vaginal bacterium and also another bacterium called anacrobies. Sometimes, without a specific cause, this bacterium grows excessively and leads to illness [39–41]. The best treatment for STIs (microbial and fungal) is herbal medicines that have the greatest therapeutic effect with the least side effects. To treat the genital yeast infection, the recommendations of traditional medicine can be followed [42–44].

Some of the therapeutic methods and medications recommended by traditional medicine across the world for STIs and genital tract infections are as follows:

1.1.1. Herbal treatments for STIs and genital tract infections

Apple vinegar, Apple vinegar is a very strong antibiotic and disinfectant agent, and its antibacterial and antifungal properties boost the immune system of the body against
pathogens [45–48]. Rosemary, Rosemary is an anti-inflammatory and antibacterial plant, and therefore is used to treat various types of infections. The easiest way to exploit rosemary properties is to use the tea or oily extract of the plant [49–52]. Garlic, Garlic is a natural, highly effective antibiotic for the treatment of various infections and its antibacterial properties are microbicidal. The extract of this plant eliminates vaginal yeast infections and reduces pain [53–56]. Treating gynecological infections by using tea tree oil, Tea tree oil treats the infection with its strong antibacterial, antifungal, and antimicrobial properties [57–59]. Basil leaf, Basil leaf is a strong microbicide and can destroy a variety of fungi and bacteria [60–62]. Aloe vera, The use of A. vera and its gel is effective in treating infection and remove itching. The nectar of the plant is effective to remove itching caused by the infection in the genitalia [63–66]. Blueberries, Blueberries are fruits that have many usages in traditional medicine and are recommended to prevent urinary tract illnesses. One of the chemical compounds of the fruit is a kind of substance called PACS that can kills the bacteria that causes the infection in the body and prevents their proliferation and accumulation. Eating blueberries is effective to get rid of fungal infection [67–70]. Oak, Oak tree bark and leaves contain tannin, sugar, gallic acid, malic acid, quercetin, mucilage, pectin, resin, and oil. Therefore, this plant has a very strong antibacterial property and produces strong effects in reducing and treating genital tract bacterial diseases and STIs [71–74]. Eucalyptus, Eucalyptus essential oil exhibits antimicrobial properties against certain bacteria. In general, the antimicrobial effects of this plant are comparatively greater on gram-positive bacteria. In some cases, eucalyptus has been prescribed for the treatment of gonorrhea, with very promising results [73–77]. Silybum marianum, S. marianum is also one of the herbal drugs that are used for treating STDs with traditional form of medicine. The S. marianum is rich in silymarin (a natural material that can destroy T. vaginalis), which makes the plant an ideal choice to fight against certain types of STDs. In addition, this substance is also used to boost the immune system of the body and therefore helps fight the parasite that causes infection in the body [78–81]. Soma, Soma is known as one of the effective traditional and herbal drugs as well as a home remedy for STDs due to its potent antibacterial properties. Leaves, tree bark, roots, and fruit of soma have high pharmaceutical value, and its anti-inflammatory and antibacterial properties will certainly help fight certain diseases like gonorrhea and syphilis. In addition, soma contains saponin, which consists of phytochemicals (plant chemicals) that help kill all types of germs, boost the immune system, and restore the body [82–85].
2. Methods

The data used in this review were obtained from scientific articles indexed in the databases such as Iran Medex, Irando, ISI, PubMed, Scopus, Web of Science, Scientific Information Database, Magiran, Google Scholar, etc., that were retrieved using the search terms: sexually transmitted infections, genital tract infections, antibacterial and antiviral drugs, medicinal herbs and natural antioxidants, medicinal herbs effective on genital tract microbial infections, medicinal herbs effective on genital fungal infection, medicinal herbs effective on genital viral infections, effects of herbal therapy on sexually transmitted infections, antibacterial and antifungal effects of plant extracts and essential oils.

In this review article, a total of 190 papers were reviewed. After the preliminary review, 70 articles were found to be eligible for the subject of our study. Relevant articles were included and irrelevant ones excluded. Finally, 70 articles were found to be related to the purpose of our study and were selected.

3. Results

Medicinal plants that were reported in this review are very important for the treatment and prevention of various types of parasitic and microbial infections and STIs (Table 1).

Based on the results obtained from our review of numerous articles, a number of plants have been reported to be used in the treatment and prevention of genital tract diseases and STIs, and to produce antiviral and antimicrobial effects, including Taxillus, Aristolochia, Syzygium cumini, Albizia adianthifolia, Bidens pilosa, Carica papaya, Ranunculus, Peltophorum africanum, Vachellia karroo, Rhoicissus tridentate, Houttuynia cordata, Panax notoginseng, Nelumbo nucifera, Astragalus, Hypericum aethiopicum, Spondias mombin, Jatropha zeyheri, Ximenia caffra, Trichilia dregeana, Clematis brachiate, Tabernaemontana, Sarcophyton.

Additional information on the pharmaceutical and therapeutic plants and also their details are given in Table 1.

The results of phytochemical investigations have shown that the most important compounds of the plants include: total flavonoids and phenolics, steroids, Alkaloids, quercetin, isoquercitrin, Dammarane-type saponin, flavonoids, alkaloids, flavonoids,
glycosides, terpenoids, steroids, astragalosides, flavonoids and polysaccharides, α-pinene, β-pinene, α-pinene, quercetin, myricetin and luteolin flavonoids, β-pinene, 1,3,8-p-menthatriene, ledene, m-menthane, linalyl acetate and 3-carene, β-sitosterol, lupeol, β, sitosterol, spathulenol, β-sitostenone, γ-sitosterol, stigmasterol., phenolic acid and flavonoids.

The most important active ingredients and important flavonoids of these plants are shown in Table 2.

#### 4. Discussion

Obtaining information on STDs and the methods of their prevention and treatment is one of the most important issues that everyone should be aware of. Fortunately, today, with the developments in technology and the promotion of human knowledge and science, many people around the world have become aware of these diseases, or at least they have become familiar with the methods of their prevention and treatment in modern medicine; however, therapeutic methods of traditional medicine and herbal supplements to treat common sexual and genital tract diseases are very important in this regard [1–7, 96–103]. The phenolic and antioxidant compounds in different organs of plants produce strong antioxidant, antiinflammatory, antispasmodic, antiseptic, and antimicrobial effects [8–10, 96–104].

Studies have shown that the plants *Taxillus, Aristolochia, Syzygium cumini, Albizia adiantifolia, Bidens pilosa, Carica papaya, Ranunculus, Peltophorum africanum, Vachellia karroo, Rhocissus tridentate, Houttuynia cordata, Panax notoginseng, Nelumbo nucifera, Astragalus, Hypericum aethiopicum, Spondias mombin, Jatropha zeyheri, Ximenia caffra, Trichilia dregeana, Clematis brachiate, Tabernaemontana, Sarcophyton* play an important role in the treatment of parasitic and infectious diseases including STIs, genital and urinary tract infections, gastroenteritis, digestive cancer, constipation, flatulence and other genital tract diseases, sexual disorders, and cancers [86–95].

As the phytochemical and pharmaceutical investigations on the herbs mentioned in this study have indicated, they contain phenolic and antioxidant compounds and are very important for various types of parasitic diseases, microbial infections, and STIs. However, the exact mechanism of these plants remains to be elucidated [107–110]. Medicinal plants studied are important for the evaluation of antimicrobial, antifungal, and antiviral activity in infectious diseases. Therefore, various medicinal plants may produce effects through more than one specific mechanism [111–114]. The results of

Phytochemical investigations have indicated that the medicinal plants have antioxidant, antimicrobial, antiviral, and antifungal properties, which may be due to the active
ingredients and active flavonoids, such as total flavonoids and phenolics, quercetin, iso-
quercitrin, Dammarane-type saponin, flavonoids, alkaloids, flavonoids, glycosides, ter-
penoids, steroids, astragalosides, flavonoids and polysaccharides, α-pinene, β-pinene,  
α-pinene, quercetin, myricetin and luteolin flavonoids, β-pinene, 1,3,8-p-menthatriene,  
ledene, m-menthane, linalyl acetate and 3-carene, β-sitosterol, lupeol, spathulenol, β-
sitostenone, γ-sitosterol, stigmasterol, phenolic acid and flavonoids, etc. This article  
mentions some of the therapeutic and medicinal plants in traditional medicine across 
the world that have antifungal and antimicrobial properties to treat STIs and genital 
tract infections. The studies have been conducted to demonstrate the prevention and 
treatment of genital tract bacterial diseases and STIs in humans by a number of common 
therapeutic medicinal plants with antibacterial and antioxidant effects and also the 
pathways in which they act; these medicinal plants may also be used to supply drugs 
in complementary medicine due to the presence of antioxidant compounds, bioactive 
compounds, phenols, flavonoids, etc. [86–95, 115–120].

Conflict of Interest

The authors declared no potential conflicts of interest with respect to the research, 
authorship, and/or publication of this article.

Authors’ Contributions

All authors searched, studied, reviewed, and contributed to the design of the research 
equally. All authors reviewed, commented and approved the final draft.

Ethical Approval

In preparation of this review article we tried to consider all ethical issues.
